

# Adolescents 13-19 Years of Age Living with HIV Infection\* and AIDS, Reported through 2001

\* For areas with confidential HIV infection surveillance. Includes 57 residents of areas without HIV infection surveillance but who were reported by areas with HIV infection surveillance.

\*\*Totals include cases missing state of residence data. Data based on age as of December 31, 2001.

\*\*\*HIV cases reported by patient name

## **Adolescents 13-19 Years of Age Living with HIV Infection and AIDS, reported through 2001**

At the end of 2001, more than 1,822 adolescents 13 to 19 years old were known to be living with AIDS in the United States. From the 37 areas that conduct adult/adolescent name-based HIV infection case surveillance, 1,244 persons aged 13 to 19 years living with AIDS were reported, representing 68% of all adolescents living with AIDS in the United States.

These 37 areas reported an additional 1,926 adolescents living with HIV infection. The HIV data underestimate the population of infected adolescents, as some states do not report HIV-infected persons to CDC, and only persons who have been tested confidentially are reported.
