

# Tools to help educate families about vaccines

texaschildrens.site/vaccine

Vaccines to prevent infectious diseases are among medicine’s most significant advances, resulting in the elimination or drastic reduction of many diseases and countless lives saved. Despite the importance of vaccines in curtailing the COVID-19 pandemic, many parents continue to delay or refuse vaccines, believing they are not necessary or safe.

The updated edition of *Vaccine-Preventable Disease: The Forgotten Story* includes families impacted by vaccine-preventable diseases and demonstrate the true cost in human suffering of not vaccinating. This updated edition also includes new stories of families impacted by RSV, measles, HPV and COVID-19. We have spent years creating these resources in the hopes that health professionals and educators will use them to start conversations with families about the importance of vaccines.

# The Immunization Project

Watch our short video series featuring families affected by meningitis, influenza, measles, HPV and COVID-19.
