

The Adult Congenital Heart Program

at Texas Children's Hospital

Acute and Critical Care Inpatient Unit

Getting the right care can transform the quality of life for adults with congenital heart disease. That's why the comprehensive Adult Congenital Heart team at Texas Children's is passionate about caring for patients well past childhood.

Our team consists largely of dual trained internal medicine and pediatric providers specializing in critical care, ACHD cardiology, electrophysiology, interventional cardiology and cardiothoracic surgery combined with a full complement of adult specialists from Baylor College of Medicine. Our integrated team approach ensures that the right experts are leveraged for each step of the patient journey. Our program offers our adult patients the pediatric congenital heart expertise necessary for advanced cardiac imaging, surgical repairs, catheter-based structural interventions and electrophysiology procedures combined with the full array of adult advanced heart failure strategies (ECMO, ventricular assist devices and balloon pumps) and cardiac transplantation producing some of the best outcomes in the world for our patient population.

Today, there are more adults than children living with congenital heart disease. These patients often neglect ongoing care and present for emergency care with arrhythmia, infection, heart failure or other complications. We are here to support and partner with you to care for the unique needs of this population.
